Please replace the paragraph at page 1, lines 4-11 with the following amended paragraph:

The present invention is related to the following commonly-assigned U. S. Patents, all of which were filed concurrently herewith: U. S. \_\_\_\_\_\_\_ (serial number 09/761,906 09/\_\_\_\_\_\_\_\_\_), entitled "Secure Integrated Device with Secure, Dynamically-Selectable Capabilities"; U. S. \_\_\_\_\_\_\_ (serial number 09/764,844 09/\_\_\_\_\_\_\_\_\_), entitled "Smart Card with Integrated Biometric Sensor"; U. S. \_\_\_\_\_\_\_ (serial number 09/761,899 09/\_\_\_\_\_\_\_\_), entitled "Technique for Establishing Provable Chain of Evidence"; U. S. \_\_\_\_\_\_\_ (serial number 09/765,127 09/\_\_\_\_\_\_\_\_), entitled "Technique for Improved Audio Compression"; and U. S. \_\_\_\_\_\_\_ (serial number 09/764,541 09/\_\_\_\_\_\_\_\_), entitled "Technique for Digitally Notarizing a Collection of Data Streams".

Please replace the paragraph at page 2, lines 7-20 with the following amended paragraph:

Pervasive devices, sometimes referred to as pervasive computing devices, are becoming increasingly popular, and their functionality (in terms of communication and processing capabilities) is increasing rapidly as well. Pervasive devices are often quite different from the devices an end-user might use in an office setting, such as a desktop computer. Typically, a pervasive device is small, lightweight, and may have a relatively limited amount of storage. Example devices include: pagers; cellular phones, which may optionally be enabled for communicating with the Internet or World Wide Web ("Web"); foreign language translation devices; electronic address book devices; wearable computing devices; devices mounted in a vehicle, such as an on-board navigation system; computing devices adapted to use in the home, such as an intelligent sensor built into a kitchen appliance; mobile computers; personal digital assistants, or "PDAs"; handheld computers such as the PALMPILOT brand handheld computer PalmPilot<sup>TM</sup> from 3Com Corporation and the WORKPAD® brand handheld computer

WorkPad® from the International Business Machines Corporations ("IBM"); etc. ("PalmPilot" is a trademark of 3Com Corporation, and "WorkPad" is a registered trademark of IBM.)

Please replace the paragraph at page 4, lines 3-16 with the following paragraph: Let us review the state of the prior art in the field of pervasive computing, as represented

by a mobile professional equipped with a collection of the latest generation of specialized personal devices. She may have a cellular telephone, a two-way pager, a "smart" credit card (also known as a "smart card"), a "smart" employee badge used to access secure areas, a PDA, a digital still camera, a digital video camera, a dictation recorder with voice recognition capability, an MP3 music player, a remote control key-chain for access to an automobile, a second remote control key-chain for access to a garage, a global positioning system (GPS) navigation aid and map pad, a weather-alert radio, and a personal health alert fob to summon medical aid – all of which may be capable of interacting wirelessly with one another, perhaps via short-range radio technology such as Bluetooth. ("Bluetooth" is a standardized technology that enables devices containing a low-powered radio module to be automatically detected upon coming into radio proximity with one or more other similarly-equipped devices. Devices incorporating this technique are referred to as "Bluetooth-enabled" devices. A standard defining the Bluetooth techniques may be found on the Web at location www.bluetooth.com.

http://www.bluetooth.com.)

Please replace the paragraph at page 8, lines 8-20 with the following paragraph:

U.S. Pat. [[\_\_\_\_\_]]6,772,331, entitled "Method and Apparatus for Exclusively Pairing
Wireless Devices", (Ser. No. 09/316,686, filed May 21, 1999) taught a technique for establishing
secure trusted relationships between devices in a Bluetooth network using special-purpose
hardware, along with software on each device. The special-purpose hardware comprises, for
example, a protected memory for storing a digital signature, where this memory is physically
attached to the radio transmitter of each device; a display screen on at least one device capable of
showing a media access control (MAC) address of the device; and an input button or other
comparable device on at least one device for the user to indicate his assent to a trust relationship.
While the disclosed technique provides security improvements for networking a collection of
devices, there is a significant cost involved. Even if such an investment were made, the overall
business process would remain unsecure against certain types of attacks. Furthermore, the
disclosed technique cannot be applied to prior art smart credit cards, which have neither a display
nor a button for indicating trust.

Please replace the paragraph at page 28, line 12 to page 29. line 7 with the following amended paragraph:

The security core now preferably computes a hash of this data block (Block 330). The security core then signs this hashed data block (Block 340) using the security core's private key. (The security core's private key is preferably securely stored in protected key storage, as shown at element 156 of Fig. 1 and as previously discussed.) Another data structure is then preferably created by the security core, where this data structure contains the original data block from Block 320 (shown as element 315) as well as the signed hash thereof which was computed in Blocks 330 and 340. This new data structure is then encoded (Block 350) as another data stream, referred to in this example as "S4", and this additional data stream is added to the collection as a notarization. In the preferred embodiments, the data streams S1 through S3 are SL-Packetized Streams within an MPEG-4 FlexMux stream, the timestamps T1 and T2 are encoded at the appropriate positions within the data streams S1 through S3 using MPEG-4 synchronization timestamp methodology, and the signed hash stream S4 is an "n+1" MPEG SL-Packetized Stream that is also timestamped so that it can be correlated with streams S1 through S3. The notarized collection of data streams S1 through S4 may then be sent to a receiver, preferably as a FlexMux Stream over a TransMux Channel. (Alternatively, the notarized collection may simply be stored for future use.) An overview of the MPEG-4 standard, provided by the international standards working group responsible for its definition, can be found on the Internet at location www.cselt.it/mpeg/standards/mpeg-4/mpeg-4.htm. http://www.cselt.it/mpeg/standards/mpeg-4/mpeg-4.htm.

Please replace the abstract with the following amended abstract:

A method Methods, systems, and computer program products, are provided for improving the security of transactions performed using smart cards, and also a card with an integrated biometric sensor. The disclosed techniques also improve the security of transactions carried out with devices such as personal or "pervasive computing" devices. Biometric sensors are used for obtaining identifying information from users of smart cards. In one aspect, this may be done by securely attaching a A smart card reader and a biometric sensor may be securely

attached to a security core, which authenticates these devices using public key infrastructure techniques, and which securely controls information exchanged with these devices. In another aspect, this is done by integrating a biometric sensor with a smart card.
